*Returns board's height.*
- int **getWidth** () const  
*Sets board's height.*
- void **setWidth** ()  
*Returns board's width.*
- **cell \*** **getUpLeft** () const  
*Sets board's width.*
- void **addColumn** (bool place)  
*Returns address of first cell.*
- void **deleteColumn** (bool place)  
*Adds first (0) or last (1) column.*
- void **addLine** (bool place)  
*Deletes first (0) or last (1) column.*

- void **deleteLine** (bool place)  
*Adds first (0) or last (1) line.*
- void **nextGen** ()  
*Deletes first (0) or last (1) line.*
- std::string **getGameRule** () const  
*Funtion returns actuall gamerule.*
- void **setGameRule** (const std::string &value)  
*Funtions change gamerule.*
- int **neibAlive** (int x, int y)  
*Funtions reurns number of neighbors alive.*
- void **border** ()  
*Checks, if there any alive cells on board's borders, then adds new columns or lines to avoid getting alive cells outta map.*

---

## Detailed Description

The board class is made of cells which may be dead or alive.

Technically, it's 4-way list made by cell class objects. Ever cell has it's own (x,y) coords counted from 0 and can be dead (0) or alive (1). You can make many different boards at the same time

### Warning

The class wouldn't work without **cell.h**

---

## Member Function Documentation

### void board::addColumn (bool *place*)

Returns address of first cell.

Funtion adds new column to existing board at the front or end

#### Parameters

|              |  |
|--------------|--|
| <i>place</i> | Switch for place for new column. 0 adds at the front, 1 at the end |
|--------------|--|

### void board::addLine (bool *place*)

Deletes first (0) or last (1) column.

Funtion adds new line to existing board at the front or end

#### Parameters

|              |  |
|--------------|--|
| <i>place</i> | Switch for place for new line. 0 adds at the front, 1 at the end |
|--------------|--|

### **void board::border ()**

Checks, if there any alive cells on board's borders, then adds new columns or lines to avoid getting alive cells outta map.

### **void board::deleteBoard ()**

deleteBoard

Class destructor

### **void board::deleteColumn (bool *place*)**

Adds first (0) or last (1) column.

Deletes first or last column of board

#### **Parameters**

|              |   |
|--------------|---|
| <i>place</i> | Switch for first (0) or last (1) column |
|--------------|---|

### **void board::deleteLine (bool *place*)**

Adds first (0) or last (1) line.

Deletes first or last line of board

#### **Parameters**

|              |                                       |
|--------------|---------------------------------------|
| <i>place</i> | Switch for first (0) or last (1) line |
|--------------|---------------------------------------|

### **bool board::getAlive (int *x*, int *y*)**

Sets if chosen cell is alive (1) or dead (0)

Function return if the cell is alive (1) or dead (0)

#### **Parameters**

|          |                         |
|----------|-------------------------|
| <i>x</i> | X coord of choosen cell |
| <i>y</i> | Y coord of choosen cell |

#### **Returns**

Returns boolean 0 if cell is dead or 1 if alive

### **std::string board::getGameRule () const**

Funtion returns actuall gamerule.

#### **Returns**

String XXX/YYY

### **int board::getHeight () const**

Returns if chosen cell is alive (1) or dead (0)

Returns actual height of board

**Returns**

Integer equal to board height

**cell \* board::getUpLeft () const**

Sets board's width.

Function returns address of first cell (coords 0,0)

**Returns**

Cell class address

**int board::getWidth () const**

Sets board's height.

Function returns actual width of board

**Returns**

Integer equal to board width

**void board::makeBoard ()**

makeBoard

Class constructor

**int board::neibAlive (int x, int y)**

Funtions reurns number of neighbors alive.

**Parameters**

|   |                 |
|---|-----------------|
| x | X coord of cell |
| y | Y coord of cell |

**Returns**

Integer equal to number of neighbors alive

**void board::nextGen ()**

Deletes first (0) or last (1) line.

Funtion evolve board by one generation

**void board::printBoard ()**

printBoard

Prints on console existing board

**void board::setAlive (int x, int y)**

Funtion switch cells statement from dead to alive or opposite way.

#### Parameters

|          |                         |
|----------|-------------------------|
| <i>x</i> | X coord of choosen cell |
| <i>y</i> | Y coord of choosen cell |

**void board::setGameRule (const std::string & *value*)**

Funtions change gamerule.

#### Parameters

|              |  |
|--------------|--|
| <i>value</i> | Must be string cointaining only digits and one '/' |
|--------------|--|

**void board::setHeight ()**

Returns board's height.

Funtion asks user for wanted board height and sets it

**void board::setWidth ()**

Returns board's width.

Funtion asks user for wanted board width and sets it

---

- projekt/**board.h**
- projekt/**board.cpp**

## cell Class Reference

Cell is object containing bool alive and 4 cell class pointers of its neighbours.

```
#include <cell.h>
```

### Public Member Functions

- void **setAlive** ()  
*Switch cell statement from dead to alive or opposite way.*
- void **setUp** (cell \*up)  
*Sets pointer Up.*
- void **setDown** (cell \*down)  
*Sets pointer Down.*
- void **setRight** (cell \*right)  
*Sets pointer Right.*
- void **setLeft** (cell \*left)  
*Sets pointer Left.*
- bool **ifAlive** ()  
*Returns statement of cell.*
- cell \* **getUp** ()  
*Returns Up pointer.*
- cell \* **getDown** ()  
*Returns Down pointer.*
- cell \* **getRight** ()  
*Returns Right pointer.*
- cell \* **getLeft** ()  
*Returns Left pointer.*
- int **neighboursAlive** ()  
*Funcions return nu,ber of alive neighbours.*

---

### Detailed Description

Cell is object containing bool alive and 4 cell class pointers of its neighbours.

It's designed to make 4-way lists, for example game board. Cell can be dead (0) or alive (1).

---

## Member Function Documentation

### **cell \* cell::getDown ()**

Returns Down pointer.

#### **Returns**

Cell pointer

### **cell \* cell::getLeft ()**

Returns Left pointer.

#### **Returns**

Cell pointer

### **cell \* cell::getRight ()**

Returns Right pointer.

#### **Returns**

Cell pointer

### **cell \* cell::getUp ()**

Returns Up pointer.

#### **Returns**

Cell pointer

### **bool cell::ifAlive ()**

Returns statement of cell.

#### **Returns**

Boolean, 0 if dead or 1 if alive

### **int cell::neighboursAlive ()**

Functions return number of alive neighbours.

#### **Returns**

Integer of alive neighbours

### **void cell::setAlive ()**

Switch cell statement from dead to alive or opposite way.

### **void cell::setDown (cell \* *down*)**

Sets pointer Down.

#### **Parameters**

|             |                   |
|-------------|-------------------|
| <i>down</i> | Cell type pointer |
|-------------|-------------------|

### **void cell::setLeft (cell \* *left*)**

Sets pointer Left.

#### **Parameters**

|             |                   |
|-------------|-------------------|
| <i>left</i> | Cell type pointer |
|-------------|-------------------|

### **void cell::setRight (cell \* *right*)**

Sets pointer Right.

#### **Parameters**

|              |                   |
|--------------|-------------------|
| <i>right</i> | Cell type pointer |
|--------------|-------------------|

### **void cell::setUp (cell \* *up*)**

Sets pointer Up.

#### **Parameters**

|           |                   |
|-----------|-------------------|
| <i>up</i> | Cell type pointer |
|-----------|-------------------|
